THE DISTRIBUTION OF LIVESTOCK

By Charles D. Bohannan
In charge of Agricultural and Rural Distribution

INTRODUCTION

This report on the distribution of livestock is one of the series of reports on the distribution of agricultural commodities issued by the Bureau of the Census. These reports represent one phase of the work of the first Census of Distribution taken in 1930, and cover the operations of assemblers and distributors of agricultural commodities for the year 1929 or the crop year most closely corresponding thereto. The reports have been prepared under the supervision of Robert J. McFall, chief statistician for distribution, in the section of agricultural and rural distribution, by Charles D. Bohannan, in charge of the section, assisted by D. W. Sawtelle, associate economist.

The purpose of the series of reports on the distribution of agricultural commodities is to present a unified picture of the distribution of the major agricultural products, such as will be of the greatest value to persons, firms, and organizations concerned with any phase of the industry—producers, buyers, dealers, manufacturers, and consumers—and also to students of the economics of agriculture in its relation to the broader problems of our national economic life. To that end the reports include not only the tabular presentation of the data from the Census of Distribution and the above mentioned related economic data, but also incorporate such analytic and descriptive materials as is felt will aid in the interpretation of the problems arising in connection with the distribution of the various products. In addition to this report on the distribution of livestock the series includes similar reports on the distribution of grain, cotton, tobacco and its products, dairy products, fruits and vegetables, poultry and eggs, and meat and meat products.

The reports in this series present the distribution data as gathered on the schedules and, by certain supplementary inquiries, from various classes of buyers, assemblers, dealers, and other distributors of the various agricultural commodities at wholesale and also at retail in cases where the agricultural product concerned is sold at retail to consumers in practically its original form or after a preliminary processing form. Thus, while the report on the distribution of cotton will deal only with the various classes of buyers and dealers in lint cotton, the reports on fruits and vegetables, poultry and eggs, and on dairy products will include data on assembling, wholesaling, and retailing. The report on tobacco and its products will be a combined report covering both leaf tobacco and manufactured tobacco.

The Census of Distribution, conducted on the enumerator basis early in 1930, was taken on the establishment basis.¹ That is, the Census covered all types of assemblers and dealers where such persons and firms had established places of business. The Census of Distribution did not cover storage or warehouse concerns, the transportation business, or strictly service businesses.

The scope of the report on the distribution of livestock.—Livestock, as the term is used in this report, refers essentially to meat animals, and hence the data do not cover assemblers and dealers primarily engaged in the poultry business nor in the handling of horses and mules. Some persons and concerns who are

engaged principally in the assembling and distribution of meat animals also handle some poultry and/or horses and/or mules. The data on such establishments are included in this report, but are so presented as to segregate the different phases of their business in so far as the schedules make possible.

This report, in addition to the data from the Census of Distribution, presents related economic data bearing on the livestock industry which it is felt will be of value in the interpretation of the problems pertaining to the distribution of meat animals. The principal sources of these related economic data are the Census of Manufactures, and the Census of Agriculture, within the Bureau of the Census; the United States Department of Agriculture, the Federal Farm Board, the Interstate Commerce Commission, and stockyard companies. In each case the specific source of the data is indicated.

The Census of Distribution covered all types of assemblers of and dealers in livestock when such dealers had established places of business. The Census of Distribution did not cover stockyards or transportation companies. Further, since the Census of Distribution was conducted on the establishment basis, schedules probably were not secured for a considerable number of independent and company resident or traveling buyers, except in so far as their business may have been reported by the packers in reporting their direct receipts, for which a special schedule was used, as indicated below, or for some livestock dealers who either have no office other than their residence or merely rent office or desk space and have no readily recognizable "place of business" or "establishment." Apparently, schedule returns were not secured for a considerable number of cooperative livestock associations for the same reason.

On the assembling or buying end of the livestock industry returns were received for livestock buyers and dealers and for cooperative shipping associations where these had established places of business. The Census of Distribution did not include the sales of meat animals by farmers as these data were secured by the Farm Census. On the distributing or marketing end of the industry reports were secured from dealers; brokers; commission men; cooperative sales agencies; and also from packers on their direct receipts of livestock.

The schedules used in securing the data on assemblers of and dealers in livestock were the regular Census of Distribution schedules. The schedule used in all places of less than 10,000 population was a general or omnibus schedule used for all types and kinds of dealers, and did not provide for commodity breakdown, either by quantity or value. In cities of over 10,000 population two schedules were used with the wholesale trade. These, however, were not schedules especially designed for securing reports on dealers in livestock nor dealers in agricultural commodities exclusively, but were the same schedules that were used in securing reports on all types and kinds of wholesalers. The differentiation between the two schedules was based on whether or not the individuals or firms reporting handled food products or other kinds of products. A special schedule was developed for the use of meat packers in reporting direct receipts of livestock.

The direct receipts of livestock by kind of animals by class of buyers and/or shippers and concentration yards were reported to the Census of Distribution direct by the packers on this special schedule. The data are so presented as to show state of origin of shipment.

This report comprising tables, maps, and descriptive material presents data on and discussion of: Regions of livestock production; the relation between number of meat animals and population; the activity of the various classes of buyers and/or shippers engaged in the purchasing or forwarding of livestock to other markets; the location of the principal stockyards with data on the number of animals received at each of them during the year 1929; the direct receipts of livestock by packers; number of meat animals slaughtered by packers; slaughter of

meat animals by retailers and wholesalers; and the location of the principal and subordinate livestock markets, together with the detailed data on types and kinds of dealers on each of the principal markets.

Importance of the livestock (meat animals) industry.—The importance of the meat animal industry in our national economic life is clearly brought out by Table 1 and Maps No. 1 to 4 inclusive, which present data on the number of meat simple are forms in relation to population and other data.

animals on farms in relation to population and other data.

With 151,637,958 head of meat animals,² on the farms and ranges of the United States; annual slaughter of 86,732,997 meat animals, in 1277 packing plants employing 145,854 persons, receiving total salaries and wages of \$220,-601,284, turning out meats and meat products valued at \$3,021,409,874, which in turn are sold at retail by some 159,000 meat and grocery and meat stores as well as numerous other kinds of stores, it is at once apparent that the meat animal industry is an exceedingly important one. About three-fourths of our population no longer live on farms and hence are dependent on the small remainder for their food stuffs, of which meat and its products form an extremely important item. Thus the problems surrounding the distribution of meat animals are seen to be of tremendous and intimate significance to all persons, whether directly connected with the industry in any of its production or manufacturing phases or merely as consumers of its products.

Something of the magnitude of the problems of distributing meat animals and the food products derived therefrom is brought out by Maps 1 to 4, showing the regions of livestock production, the location of the packing plants, and the concentration of population. The data on which the maps are based are contained in Table 1, which shows for each State the number of head of various kinds of meat animals and the number per 1,000 population; the number of meat animals slaughtered in each State by packers and by retailers and wholesalers.

Regions of production in relation to regions of consumption.—The location of the production regions for meat animals in relation to population, or potential consumer demand is shown quite clearly in Table 1 and Maps No. 1 to No. 4.

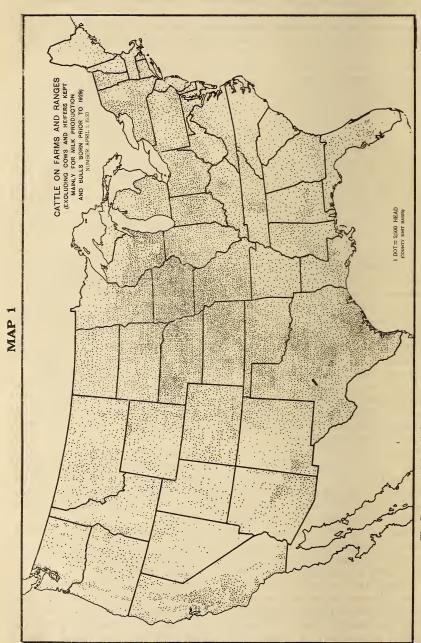

Of the total population of the United States approximately 70 per cent is east of the Mississippi River, in fact, almost 50 per cent is in that section of the country east of the Mississippi River and north of the Ohio line. While as shown in the following discussion the much larger share of meat animals of all kinds is found west of the Mississippi River.

Cattle.—Map No. 1 and Table 1 show where the cattle of the country are by States. Note the concentration in the Western and Southwestern range regions and the Corn Belt, and that 73 per cent of the cattle are in States west of the Mississippi. The eastern corn and winter-wheat States—Illinois, Indiana, Ohio, Kentucky, and Tennessee—contain 10 per cent. The three leading States in number of beef cattle are: Texas, Iowa, and Nebraska.

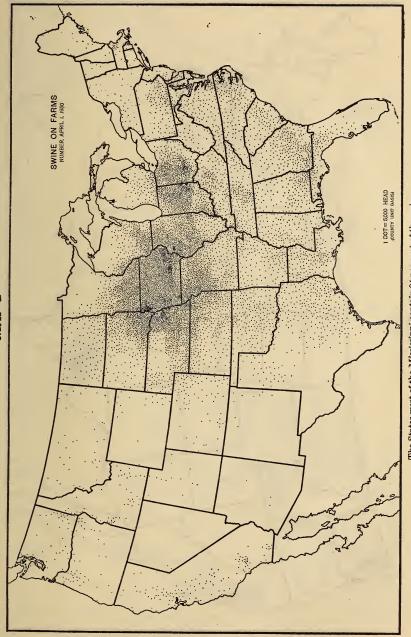

Many of the cattle produced on the ranges are shipped into the Corn Belt States for finishing, either via stockyards, direct from rancher to feeder, or through the feeder shipment service of some of the cooperative associations. However, many cattle are also raised on the farms of the Corn Belt region.

Roughly then, as to the sources of cattle supply for the meat industry, the country can be divided into two sections: Range country and the Corn Belt, although there are certain supplementary supply areas of importance for fattened or finished stock—namely, around Lancaster, Pa.; the Flint Hill section of Kansas; the vicinity of Mineral Point, Wis.; Appalachian Pasture Region including part of the following States: Kentucky, Tennessee, West Virginia, Virginia, and North Carolina.

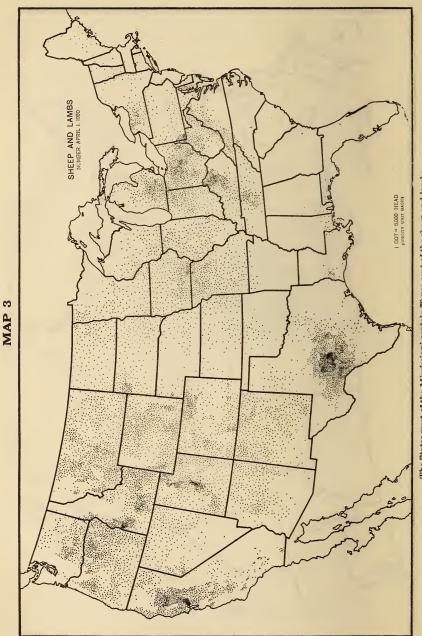

² Includes cattle (excluding cows and heifers kept mainly for milk production, and bulls born prior to 1929); hogs and pigs; sheep and lambs

The States west of the Mississippi contain 73 per cent of the cattle but only 30 per cent of the population

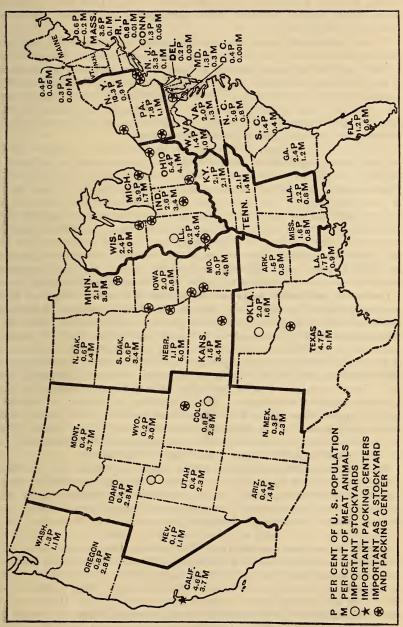

The States west of the Mississippi contain 94 per cent of the swine

The States west of the Mississippi contain 78 per cent of the sheep and lambs

Population and meat animals-Location of principal stockyards and principal packing centers

129211-33 -2

Hogs.—The heaviest supplies of hogs come from the Corn Belt States as is shown by the data on hogs on farms in Table 1, and by dot map No. 2. The three leading States in hog production are as follows: Iowa, 10,055,591 or 18 per cent of the total number; Nebraska, with 4,679,161, or 8 per cent; Illinois, with 4,651,772, or 8 per cent.

Of the Southeastern States Georgia is the most important in hog production. This region as a whole showed a notable increase in the number of hogs from 1910 to 1920, but the last decade showed a decidedly downward trend in the number of hogs on farms throughout the Cotton Belt, as well as in the Eastern States which are north of the Ohio River. On the other hand, a substantial increase in the number of hogs on farms was shown by the leading hog States—Iowa (24 per cent) and Nebraska (54 per cent) as well as by Minnesota (40 per cent), Montana (96 per cent), and Wyoming (86 per cent).

Sheep and lambs.—Data on federally inspected slaughter show that about 91 per cent of the combined slaughter of sheep and lambs is made up of lambs and yearlings and only about 9 per cent sheep. However, data are not available to show separately the number of sheep and of lambs on farms. Hence, the data in Table 1 and map No. 3 include both. Reference to the table and map shows quite clearly that the bulk of the sheep and lambs are in Texas and the Rocky Mountain and Pacific States with other relatively heavy production regions in central and eastern Ohio, southern Michigan, central Kentucky, and along the Appalachian ridge. It should be pointed out here, however, that the farms in the Minnesota, Iowa, Missouri, and Illinois region also have considerable quantities of sheep and play an important part in supplying the market demand.

Production point activities in the distribution of livestock.—Farmers' sales of meat animals may be made to or through any one of a number of agencies or channels, depending on local conditions and the volume of their sales. In the southwestern range cattle country where large numbers are moved to market at one time, the rancher may ship one or several carloads of cattle or calves direct to a stockyard market. In the Corn Belt and Eastern States the larger breeders and feeders may ship on the same basis or through a cooperative shipping association. Many head of beef cattle and calves are sold to local or traveling buyers, either independent or company. The independent buyer may in turn sell to another buyer, either nearby or at a more remote market. In the general farming States some farmers buy considerable quantities of cattle from others, either in the immediate vicinity or at times at some distance, marketing immediately those in better condition and finishing off the others in the feed lot.

Thus in the movement from producing regions, livestock may be shipped directly by producers to stockyards for sale to or through some dealer; direct to a packer; through a cooperative shipping association to a stockyard, for sale by a dealer, or to a packer, or to a cooperative sales agency, or to feeders; or sold to a local resident or traveling independent or company buyer; or to a local packer, or to a retailer or wholesaler who slaughters for his trade.

Country buyers and assemblers.—The Census of Distribution did not secure such data as to enable us to show the number of head of meat animals handled by various classes of buyers and/or shippers, nor to show the different hands through which various shipments or volumes of livestock move. Such detailed data as these were not secured, since, as stated above, the Census of Distribution was taken essentially on the establishment basis and many buyers of livestock have no established place of business, the same being true of some cooperative shipping associations. It is probable, however, that the percentage of coverage is practically uniform throughout the country so that the data herewith presented do serve to give not only the first picture of this situation on the national basis but also provide adequate basic data for further detailed research within any market

area by organizations or individuals interested in studying their immediate problems.

As will be noted from Table 2, which presents the data on all types of dealers in livestock by States, and by counties, wherever possible, 4,144 country buyers and assemblers of livestock in 1929 had sales totaling \$311,559,513, and in addition 1,101 cooperative shipping associations had sales of \$154,494,903.

As indicated in Table 3, schedule returns were also received for a considerable group of dealers who handled other commodities in addition to livestock, but the reports on their businesses do not enable us to present the livestock figures separately. These dealers include 940 assemblers and country buyers with total sales of \$71,402,397 and 164 cooperatives with total sales of \$30,859,183.

Examination of Table 2, shows that even in those States containing a relatively large number of livestock there is considerable variation as to the number of country buyers and assemblers and cooperative shipping associations. It will be noted that in the range States such local buyers and assemblers enter into the distribution of livestock to a relatively small degree as compared with the Corn Belt and mixed farming States. This is due to the fact that livestock move from the ranges in car-lot and train-load shipments direct from producers.

Other types of livestock dealers.—Table 2 also presents data showing number and total sales of livestock dealers other than assemblers and country buyers and cooperative shipping associations. These "other types of dealers" include so-called dealers, commission merchants, order buyers, and cooperative sales agencies. This table shows that in 1929 1,320 such dealers had total sales of livestock valued at \$2,594,841,860. In addition Table 3, which covers the sales of dealers in livestock and other commodities, shows that there were 465 "other types of dealers" doing a volume of business in livestock and other commodities valued at \$106,399,331. While Table 2 presents these data in summary fashion further details are shown in Table 4 for the principal livestock markets including the number of different types of dealers, and sales by types of dealers, together with salaries and wages wherever possible. However, there is not a sufficient number of each type of dealer on each market to enable us in all cases to show sales by each type of dealer without revealing individual businesses.

In considering the total sales of livestock by these various classes of dealers it should be kept in mind that, as stated above, the figures do not necessarily represent the net sales of livestock, due to the fact that the same lot of livestock may be sold several times before reaching the slaughter house or the feeder.

Packers' direct receipts of livestock.—The data on direct receipts of livestock by packers throw additional light on production point marketing of livestock. The data on direct receipts, which were received on special schedules direct from packing plants, are presented in Tables 5 to 10. These tables show for each of the several classes of meat animals the number of each received by packers from various States, from company buyers, independent buyers, individual farmers, and cooperative associations.

While information is not available to show the number of each class of buyers and/or shippers sending in these livestock direct to the packing plants, the tables serve to indicate that such buyers and shippers play an important part in the production point marketing of livestock. Especially is this true in the case of swine.

The importance of the direct receipts method as a source of supply of livestock for slaughter.—Until within comparatively recent years packers located at central markets obtained practically all of their supply of livestock through stockyards, generally located at or near their packing plants. Due to economic developments, among which were the expansion of the activities of the so-called "interior" packers and the development of the good roads systems and increased motor

transportation facilities, the other packers began to develop to a much greater extent the production point purchases of livestock, noticeably swine. The data in the table below indicate that for the 268 plants reporting direct receipts such receipts represent 15 per cent of the total slaughter in the case of cattle, 24 per cent of the calves slaughtered, 57 per cent of the swine, 19 per cent of the sheep and lambs, and 98 per cent of the other animals.

Direct Receipts of Livestock in Relation to Total Slaughter of the $268~\mathrm{Plants}$ Reporting

[Summary for the United States]

	NUMBER OF AN	IMALS SLAUGH- ED	DIRECT RECEIPTS OF LIVESTOCK								
	By all packers	By 268 plants reporting di- rect receipts	Number of head	Per cent of slaugh- ter by all packers	Per cent of slaugh- ter by 268 plants						
UNITED STATES											
Total	86, 840, 340	60, 610, 773	26, 470, 283	30	44						
Cattle	10, 133, 243 5, 568, 975 55, 011, 511	6, 310, 586 3, 397, 198 39, 166, 343	963, 308 821, 310 22, 400, 860	10 15 41	15 24 57						
Sheep Lambs	16, 019, 268	11, 681, 499	2, 230, 948	14	19						
Other animals	107, 343	55, 147	53, 857	50	98						

Slaughter by retailers and wholesalers.—The part played by retailers and wholesalers in the local marketing of meat animals is indicated in Table 1. This table presents data by kind of animals reported as slaughtered by retailers and wholesalers in the different States during the year 1929. It shows total slaughter by such concerns of 1,002,269 calves, 1,114,781 other cattle, 1,894,068 hogs, 349,232 sheep and lambs, and 25,949 goats and kids. Since such retailers and wholesalers obtain practically their total supply of meat animals in the immediate vicinity of their place of business, in some States they play an important part in furnishing a local market outlet for meat animals.

It should be pointed out that "retailers" as here used refers to retail stores and that the data include reports obtained from retailers in cities and towns of all sizes. On the other hand, the term "wholesalers" as here used includes produce buyers, meat wholesalers, livestock buyers, and some slaughter houses. Reports were received for such wholesalers only in towns of under 10,000 population. It should be specifically noted that these "wholesalers" do not include the wholesale slaughterers and packers since these were covered by the Census of Manufactures. Hence, the data here given do not involve any duplication of data on slaughtering as published by the Census of Manufactures.

Stockyards in the distribution of livestock.—As stated above, stockyards were not covered by the Census of Distribution as such. However, they are so important that it is essential to present certain data thereon in any report on the distribution of livestock. Accordingly, reports on receipts of livestock by kind were secured from some of the more important stockyards. These data, together with data published by the Department of Agriculture ("Crops and Markets, 1929") are combined in Table 11, showing the number of each kind of meat animals received at stockyards in 65 cities in 1929. The 25 most important stockyards are shown separately. The combined total receipts at these 25 stockyards by kind of animals were: 5,150,314 calves, 12,418,385 other cattle, 37,215,-102 hogs, and 24,425,114 sheep and lambs.

It should be noted that some of these stockyards are located at important packing centers. On the other hand, some of the stockyards are located at points which do little packing and hence such stockyards are essentially concentration or reshipment points. This is brought out clearly by the table in the columns which show the per cent of the receipts of each class of animals which were reported as shipped. For example, Chicago and Omaha shipped but 31 and 41 per cent, respectively, of their total receipts of cattle. In the case of such stockyards as Denver and Wichita the shipments of cattle were 76 and 73 per cent, respectively, of total receipts, while Pittsburgh shipped 80 per cent of its total receipts. Chicago and South St. Paul shipped 4 and 3 per cent, respectively, of their total receipts of calves, while East St. Louis and Sioux City shipped approximately two-thirds of their total receipts of calves, and Pittsburgh, 77 per cent.

A similar situation naturally exists in the case of sheep and lambs, on account of the heavy receipts at stockyards located close to the producing regions, such as Pittsburgh, Denver, Ogden, Salt Lake City, and Pueblo, which ship on to other

points 90 per cent of their receipts.

In other words, the data on total receipts by all stockyards do not show a net movement of livestock, as receipts at some stockyards include animals also reported as received at other stockyards during the same year.

Map No. 4 shows the location of the 25 most important stockyard points,

based on the total receipts of meat animals.

Seasonality of movement of meat animals through stockyards.—Table 12 shows for each of the 25 leading stockyards the total receipts of livestock by kinds for the year 1929 by months. Further, there is shown the per cent which the receipts each month formed of the receipts for the year. These data are also graphically presented in chart No. 1.

The movement of cattle through these stockyards is fairly uniform for 6 months out of the year as indicated by the fact that for 6 of the 12 months the receipts vary only slightly from the yearly average. On the other hand, it should be noted that there was a decided peak in September and October, with the low point in February.

Receipts of calves at these same markets apparently were on a still more uniform basis since in nine months out of the twelve the receipts quite closely approximated the average. However, here again there was a peak movement in April and another in October, the lowest receipts being for the month of February.

In the receipts of hogs the high point was in January with the low point in June, although it should be noted that in the case of hogs there were only seven months in which the receipts varied to any considerable degree from the average.

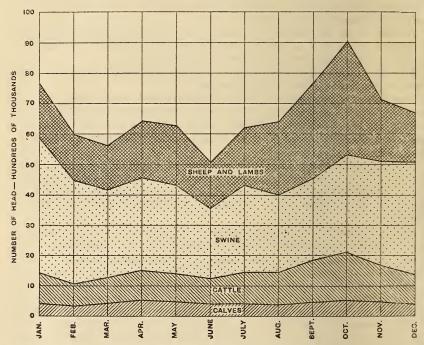

The movement of sheep and lambs to these markets shows a greater fluctuation from the average. The high point came in September and October and the lowest receipts in March and again in June.

Seasonality of movement from producing regions.—While as shown above, the receipts of beef cattle at these 25 stockyard markets are fairly uniform throughout the year with the exception of about four months, the two charts, Nos. 3 and 4, show that the receipts of beef cattle from the Corn-Belt States are much more uniform than they are from the range States. From the range States the heavy movement comes in the fall, following the fall round-up and continues through September and October, dwindling off in November quite rapidly with the coming of winter storms. The movement of sheep and lambs from the various producing regions is shown in chart No. 2.

Relative importance of different kinds of meat animals in total receipts.— Table 11 also shows the rank of each stockyard point in total receipts of meat animals and in receipts of each kind of animal. Inspection of these rank figures shows a considerable variation in the importance of some cities in receipts of different classes of animals. In fact, only Chicago, which ranks first on all counts, has the same rank throughout. Notable cases of variations are South St. Paul, ranking fifth in total receipts, but eighth in receipts of sheep; Sioux City, ranking sixth in total receipts, and receipts of cattle and hogs, but eleventh in receipts of sheep and twenty-fifth in receipts of calves; Jersey City, ranking twelfth in total receipts, but fourth in receipts of calves and sixth in sheep and lambs; Milwaukee, nineteenth in total receipts and third in receipts of calves; Baltimore, ranking sixteenth in total receipts, but tenth in receipts of hogs.

Transportation of meat animals.—Data are not at hand to show in detail the number of head of meat animals traveling various distances to reach the point

CHART 1.—MONTHLY RECEIPTS BY KIND OF ANIMALS AT 25 LEADING STOCKYARDS, 1929

Note the uniformity of receipts of calves and also cattle as compared with swine and sheep and lambs

of sale, whether at stockyard points or elsewhere. However, the following data on the per cent of different kinds of meat animals received at different stockyards from various States may serve to throw some light on this point.

Chicago ³ in 1929 received cattle from 35 States, but over 60 per cent came from Illinois and Iowa; 25 per cent from Illinois and 38 per cent from Iowa. Receipts from no one of the other States were as much as 8 per cent of the total. Of the calves received in Chicago from 25 States, 30 per cent were from Illinois, 24 per cent from Iowa, 31 per cent from Wisconsin, and not exceeding 4 per cent from any of the other States. In the case of hogs, receipts came from 22 States, but 48 per cent were from Iowa, 30 per cent from Illinois, 10 per cent from South

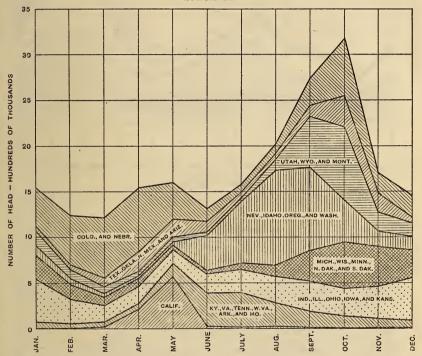

³ Data on receipts at Chicago from Duddy, E. A., and Revzan, D. A., The Supply Area of the Chicago Livestock Market. University of Chicago Press, 1931.

Dakota, and the receipts from no other State exceeded 6 per cent. On the other hand, a larger percentage of sheep and lambs came from States at a greater distance, while over half of the total receipts came from the following States: Iowa, 15 per cent; Illinois, 12 per cent; Colorado, 15 per cent; Montana, 9 per cent; and California, 8 per cent.

Omaha in 1929 received cattle from 21 States, but of the total receipts 63 per cent came from Nebraska, 15 per cent from Iowa and not over 9 per cent from any other State. Hogs came to Omaha from 13 States with 77 per cent from Nebraska, 19 per cent from Iowa, and not over 3 per cent from any other State. Sheep and lambs were received from 18 States, 37 per cent from Nebraska,

CHART 2.—MONTHLY MARKET RECEIPTS OF SHEEP AND LAMBS FROM STATES

Specified

20 per cent from Idaho, 13 per cent from Wyoming, and 10 per cent from Colorado.

As indicated on maps No. 1 to No. 4 and in table No. 1, the regions of heaviest meat animal production are far removed from the most heavily populated areas. Prior to the development of the refrigerator cars the live animals were transferred to packing plants on or within easy reach of the Atlantic seaboard. The coming of the refrigerator cars made possible the development of packing plants nearer the source of supply and a consequent saving in transportation costs. The saving here, of course, being in the transportation of finished products having higher value per pound than the raw materials. Hence, while some shipments of meat animals still reach eastern markets from the West, the great bulk of the meat animals move into the large central packing point stockyards, some from comparatively nearby areas.

Data on receipts at Omaha from annual stockyard report.

CHART 3.—MONTHLY MARKET RECEIPTS OF CATTLE FROM THE RANGE STATES

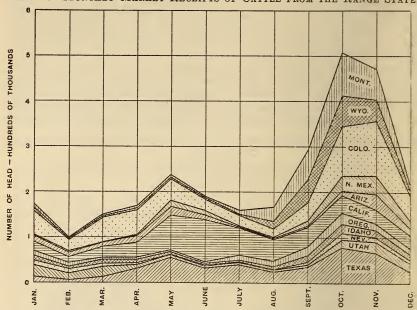

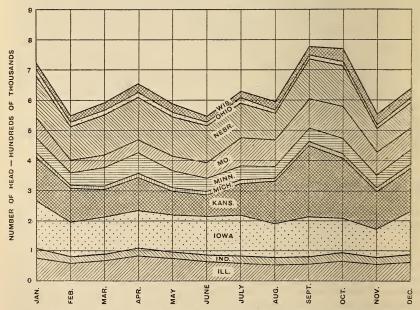

CHART 4.—MONTHLY MARKET RECEIPTS OF CATTLE FROM THE CORN-BELT STATES

Note the greater uniformity of receipts from the Corn-Belt States which include animals raised there and stock finished there but raised in the range States. The receipts from range States are largely concentrated in the fall months, then dropping off rapidly with the onset of winter months

As stated in the introduction, transportation agencies were not included in the Census of Distribution. Neither are detailed data available from other sources to present anything like a complete picture of the importance of the meat-animal industry in relation to transportation. That the industry does furnish a very important amount of revenue freight traffic is indicated by the fact that during 1929 the total car loadings of livestock were 1,419,000 cars, while shipments of meat and other packing-house products furnished in 1929 revenue fleight to the amount of 5,281,000 tons.⁵

Transportation of meat animals by truck.—While railroads are still the chief means of transportation of livestock, the recent developments of roads and automotive equipment have given a considerable emphasis to motor-truck transportation of meat animals. Data are not available to show receipts of meat animals by truck at all stockyards. However, so much importance attaches to this development that the following data on the truck movement of livestock are of especial interest at this time. Table 13 shows the number of animals of all kinds reported received by truck at 13 stockyards, including the five largest. It also shows the per cent which the receipts by truck form of the total receipts of each kind of animals.

While truck receipts accounted for only 18 per cent of the total receipts of these stockyards, there is a considerable variation in the percentage of truck receipts by kind of animal and also between the different stockyards. Thus 13 per cent of the total receipts of cattle came in by truck, 24 per cent of the calves, 23 per cent of swine, and 10 per cent of the sheep and lambs.

Note especially the small percentage of Chicago's receipts received by truck. This should be contrasted with the much higher percentage of receipts by truck at some of the stockyards located closer to producing regions. Thus Omaha and Sioux City receive respectively 45 per cent and 38 per cent of their total receipts of calves by truck and 43 per cent and 64 per cent of their total receipts of swine.

The increasing use of trucks for the distribution of meat animals is emphasized by the following comparative data for the four stockyard points as indicated. The data presented are for the years 1925 and 1929. In each case it will be seen that there has been a very considerable increase in the number of each kind of animal received by truck.

Additional data on movement of live stock by means of trucks were obtained from the packers who reported on direct receipts of livestock. The 172 packers

⁵ Data from the Statistical Abstract, 1931.

⁶ Data from the reports of the stockyard companies.

who reported the receipt of livestock at their plants by truck indicated that they received a total of 4,152,253 head in this manner. In this number were included 333,662 calves; 221,400 other cattle; 3,340,765 swine; 97,955 sheep; 137,649 lambs; and 20,822 other animals. Since these animals were received by direct receipt and not through stockyards, these truck receipts do not include any duplication of stock received by truck at stockyards.

According to a bulletin issued by the University of Illinois, ⁷ the total number of livestock trucked to 8 markets in 1929 amounted to 10,774,446 head as compared to 2,058,696 head in 1920.

Number of dealers and total sales by types of dealers on the principal livestock markets.—The cities in which the principal livestock markets are located are indicated in Table 4. This table includes all cities in which the sales as reported totaled at least \$1,000,000 and where there were at least three dealers reported. The table presents first for each city the total number of dealers from whom reports were secured, their total sales, number of employees, salaries and wages, and total expenses. In addition, the number of dealers and total sales are given by type of dealer in so far as this is practicable without revelation of individual businesses. In this table the following classifications are used: Assembler, broker, commission merchant, dealers and traders, and the general classification of all other types. Since on most markets there were not enough cooperative sales agencies so that their business could be shown separately, they have been included with commission merchants as their methods of operation are quite similar.

It will be noted that the classification "assembler" has been used only in the case of the smaller cities; and dealers so classified in each instance reported over 50 per cent of their dollar volume of livestock business as being purchased direct from producers. Order buyers were classified as "brokers." The differentiation as between a cooperative marketing association and a cooperative sales agency is that the former is a local producers' organization while the latter is a central sales agency operating for the benefit of a number of local cooperative livestock marketing and shipping associations. Altogether there are 33 such cooperative sales agencies on these markets with sales of \$334,420,915.

Some commission merchants do a part of their business on the basis of outright purchase and sale, while still others operate partly as order buyers. A firm calling itself a commission merchant whose schedule indicated that it did over 50 per cent of its business on a commission basis was classified as a "commission merchant."

The classification "dealers and traders" includes firms reporting themselves under one or the other of these classifications and also some firms who checked themselves as "wholesalers" or "jobbers," doing this probably because the wholesale form on which they reported was not especially adapted to the livestock business but was a general wholesale schedule.

It will be noted in a number of cases that the number of establishments is given but the sales are not. In each case, however, the sales are included in the total for the city. In considering this table it should distinctly be kept in mind that, as stated in the introduction, the Census of Distribution was taken essentially on the establishment basis, and it is not to be assumed that schedules were received from all dealers and traders on all markets. However, for the purpose of making the most complete presentation possible, this table does include the data on such schedules as were received for such concerns. Further it should again be pointed out that the total sales in any city do not necessarily indicate net sales of livestock at that point since there is on some markets a considerable amount of interdealer sales of livestock.

⁷ Ashby, R. C., Livestock Truckage Rates in Illinois, Bulletin No. 342, February, 1930.

The leading livestock markets as indicated by the data on this table are as follows: Chicago, Kansas City, Omaha, National City, Sioux City, South St. Paul, South St. Joseph, Indianapolis.

Location of the packing industry.—Map No. 4, above referred to, shows the location of the most important packing centers. Table 14 shows the total reported slaughter 8 and the rank in slaughter by kind of animals for each of the cities where the data can be shown without revealing individual businesses. Chicago leads both in total slaughter and in the slaughter of each kind of meat animals excepting calves, in which it is third. The other cities show considerable variation in rank as between different classes of meat animals slaughtered. Interesting illustrations of this are: Kansas City ranks second in total slaughter, and slaughter of cattle and swine, but only sixth in slaughter of calves; South St. Paul ranks fifth in total slaughter, but second in slaughter of calves and seventh in slaughter of sheep and lambs; Fort Worth ranks thirteenth in total slaughter but fifth in slaughter of calves.

Seasonality of slaughter.—Table 15, based on data on federally inspected slaughter, shows the total slaughter by kind of animals for each month during the year 1929; the average monthly slaughter; and the per cent slaughtered each month. The relatively heaviest slaughter of hogs is during the months of January, February, November, and December; and in the case of cattle, September, October and January. Slaughter of calves is relatively highest in the spring months of March, April, and May, with another smaller peak in October. The peak in the slaughter of sheep and lambs comes in the fall months, beginning with August. This latter represents the movement into consumption of spring lambs. As stated above, statistics show that lambs represent 91 per cent of the combined total slaughter of sheep and lambs.

Distribution of meats and meat products.—The foregoing discussion has covered the Census of Distribution data and other related data on the assembling and distribution of meat animals. The wholesale and retail distribution of meats and meat products will be covered in a special report to be issued later.

 $^{{}^8}$ Data on federally inspected slaughter from Bureau of Animal Industry, United States Department of Agriculture.

¹ Excludes cows and heifers kept mainly for milk production, and bulls born prior to 1929.
2 Data from Census of Agriculture.
3 Data from Census of Population.
4 Data from Census of Manufactures.
5 In addition packers reported slaughtered for others on custom or cooperative basis 585,607 head of cattle; 360,243 calves; 330,325 sheep and lambs; and 1,309,139 swine.
6 Can not be shown separately, but included in United States total.
7 Does not include slaughter by packers. See note (6).

¹ The term "sales" here used includes both sales on own account and purchases for the account of others. The sales figure does not include the value of sales at retail which were made by some of these dealers. The total of such retail sales by this group of dealers for the United States is \$3,117,353.

2 Includes Arizona; Connecticut; Delaware; New Hampshire; New Jersey; New Mexico; Rhode Island; and Wyoming.

(x) Included in county total to prevent revelation of individual businesses.
